Hermes Agent Cheat Sheet

Install, configure, fix and run Nous Research's open-source agent. One page.

AI Engineer Insights
aiengineerinsights.com · Oct 2026

1 · INSTALL

`curl -fsSL https://hermes-agent.nousresearch.com/install.sh | bash`	Official installer (macOS, Linux, WSL2)
`pip install hermes-agent`	Python install
`docker pull nousresearch/hermes-agent:latest`	Container image
`docker run -it -v ~/.hermes:/root/.hermes nousresearch/hermes-agent:latest`	Run it; the volume keeps config and memory between runs

> **Windows:** run the agent under WSL2. If PowerShell blocks the script, use an Administrator shell or install inside WSL2.

2 · FIRST RUN & MODELS

`hermes setup --portal`	Easiest start: Nous Portal model + Tool Gateway tools
`hermes model`	Choose or switch provider and model, paste API key
`hermes` / `hermes --tui`	Start the agent (modern TUI)
`hermes gateway setup`	Telegram, Discord, Slack, WhatsApp, Signal

> **Rule:** the model needs a context window of at least **64,000 tokens**, or the first message fails.

3 · SESSIONS

`hermes --continue` / `hermes -c`	Resume your last session
`hermes sessions list`	Find a saved chat
`/model`	Switch model inside a session
`/voice on`	Voice mode (needs the voice extra)

4 · SKILLS

`/skills`	Browse skills inside a session
`/skill skill-name`	Load a skill mid-session
`hermes -s "skill-name"`	Load a skill at launch
`hermes skills create`	Scaffold a new skill
`~/.hermes/skills/`	Where skills live

> Turn on `write_approval` so skills the agent writes are staged for review, not applied silently.

5 · WEB UI & DESKTOP

`hermes dashboard`	Start the local web dashboard
`http://127.0.0.1:9119`	Open it in any browser (runs locally)

6 · FILES THAT MATTER

`~/.hermes/.env`	API keys and secrets
`~/.hermes/config.yaml`	Settings
`~/.hermes/skills/`	Skills

7 · FIX IT

`hermes doctor`	**Run first.** Checks PATH, keys, model, build
`hermes doctor --fix`	Same checks plus automatic repairs; YAML and custom-provider issues are left for you
`hermes update`	Latest version, then re-run `hermes doctor`
`hermes: command not found`	`source ~/.zshrc` or `source ~/.bashrc`, or open a new terminal
Context-window error	`hermes model`, pick a 64k+ model
Provider / auth failed	Check the key in `~/.hermes/.env`, then `hermes model`
Docker forgets everything	Mount `-v ~/.hermes:/root/.hermes`

8 · MIGRATE

`hermes claw migrate`	Import an OpenClaw setup (preview first)
`hermes import-agent claude-code`	Bring CLAUDE.md, permissions and MCP servers across
